
RKAndroidTool V1.35 Fix

[Download](#)

In Windows, open the cmd.exe in admin mode and enter this:cd\Program Files\RockChip\RkFlashKit\Basecd..This will make sure you dont get a message about the missing file.To enable development mode in windows, go to Start| > All Programs | Accessories|Development Tools | RKAndroidTool.rklocated in Program Files\RockChip\RkFlashKit and double click the.rklocated there to enable it.Now, in your Windows registry, delete the following keys:HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Control\Class\{4D36E972-E325-11CE-BFC1-08002bE10318}and reboot your device.Now you should be able to access Windows Memory Card Terminal app from USB, select your device and use your usb cable to connect the device, maybe with FTGreen cable.Now, assuming Windows 10, open Windows Device Manager from start menu, and try to find "RKAndroidTool driver". Install it and the map the name of the driver

to the USB name when you connect your tablet. The new usb name should be "Getyy E-5" Now, open RKAndroidTool, and select the USB you've connected and it should find your device, usually its one of the first entries when scrolling down. Next, you'll need to select the firmware zip file you've extracted from the downloaded image. Do this by:

- a. Selecting the firmware file (in my case its the first zip file "README.mk908.htf" located in the MTK firmware folder)
- b. Selecting the bootable flag by clicking on the "Laser Red" icon located next to "Bootable, by...."
- c. Selecting the image name (2nd file "IMG_0001.mk908.htf", located in the same folder)
- d. Selecting the name, button name, and case of the device (to my device its "A75" > "MAIN" and "WHT", located in the MTK firmware zip file, under the "Cases" folder)
- e. Selecting the mount point and file size (I've chose "/media/my_msc" and 700 MB)
- f.

Clicking on the flash button.In my case the process has failed, I have attached the log file in a ZIP file. Maybe the cause is that I selected the wrong USB port, as I got different information if I first plugged my tablet in the USB2 port (after playing with it for a while), and in the USB3 port. I have also tried all the drives to find the right one, in the end, I selected the USB1 port and I have waited about 45-55 seconds while the green LED was blinking, and nothing happened. There is no need to reboot after this step, you can leave the tablet alone until the process is completed, and the device will be usable again.

RKAndroidTool V1.35

Ive tried using RkAndroidTool 1.40 in ReactOS(instead of Windows, but I did not manage to make it work. I used VirtualBox image to run ReactOS in Ubuntu 12.04. The OS is alpha and not so stable, so the first

thing I did was to find a web browser that does not crash during Launch, Opera 9.64 did the job. Then I could download RkAndroidTool, some firmware files, and 7-Zip utility to uncompress firmware. RockUSB driver appears to install properly after I connected MK908 in recoveryRead more I've tried using RkAndroidTool 1.41 in ReactOS(instead of Windows, but I did not manage to make it work. I used VirtualBox image to run ReactOS in Ubuntu 12.04. The OS is alpha and not so stable, so the first thing I did was to find a web browser that does not crash during Launch, Opera 9.64 did the job. Then I could download RkAndroidTool, some firmware files, and 7-Zip utility to uncompress firmware. RockUSB driver appears to install properly after I connected MK908 in recoveryRead more I've tried using RkAndroidTool 1.42 in ReactOS(instead of Windows, but I did not manage to make it work. I used VirtualBox image to run

ReactOS in Ubuntu 12.04. The OS is alpha and not so stable, so the first thing I did was to find a web browser that does not crash during Launch, Opera 9.64 did the job. Then I could download RkAndroidTool, some firmware files, and 7-Zip utility to uncompress firmware. RockUSB driver appears to install properly after I connected MK908 in recoveryRead more After reading the needed steps again, it seems I did it all correctly and that maybe RkAndroidTool is faulty, I uninstalled and reinstalled it from Windows 7 but nothing changes. I tested the tool again with my Nexus 4 and it works. The Nexus 4 has only one partition, so there should be no problem selecting it but I get an error that the program can't detect the device. Other devices like my Nokia N9 works fine, just the Nexus 4. 5ec8ef588b
