Overall, I'd say that Lightroom CC is still a very capable image management and RAW conversion software, even though it feels a tad older now. Rest assured that growing pains are normal in software development and that Adobe - from time to time - introduces new features that allow you to use Photoshop to its full potential. In my opinion, software is only as good as its companion hardware, which is why my current rant about performance problems is directed more at Adobe than Apple. The original iPhone was a piece of junk when compared with the current model. Now, the same applies to Photoshop. Generally speaking, Adobe's Photoshop will serve you well if you are already quite familiar with photoshop and its tools. As long as you feel comfortable with what you are working on, it should be easy to leverage your knowledge and apply it successfully in Photoshop CC. If you are an experienced Front-End web designer or web developer, you will definitely appreciate this software. You'll become even more productive because you don't have to spend time searching through the gallery of images to find the right one, editing it in a different photo editor (***WITHOUT TAKING UP A FEW THOUSAND PIXELS***), and then proceed to finishing it off. The new Darkroom is easily one of the most significant additions and, given that this tool has been around it since the original Photoshop Sketch, I'm glad to see its improvements. Also, the ability to save your work anywhere any time has now become a reality. The best part, however, is that you can remove the background - a feature that would have been quite useful for those of us who use it to test changes on small samples, or even do full-page mockups.
